                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              comprises providing a test sample comprising a polypeptide that contains a discordant helix in the form of an I-helix, contacting the test sample with a test compound and determining the rate of decrease in the amount of I-helix or the amount of I-helix present in the test sample. The method is useful for identifying a compound that stabilises an I-helical conformation of a discordant helix in a polypeptide. Such compounds are useful for decreasing the rate of formation of theta-strand structures between at least two discordant helix-containing polypeptides, and for treating amyloidogenic discorders such as amyloidosis in Alzheimer's disease, and prion diseases (e.g. scrapie, bovine spongiform encephalopathy (BSB), Creutzfeld-Jacob disease (CJD)). The present sequence represents human Abeta fragment (amino acid residues 1-40)
                                                                                                                                                                          The invention relates to a method for diagnosing Alzheimer's disease or identifying an individual at risk of the developing the disease. The method involves measuring abundance of low-density lipoprotein receptor related protein-1 (LRP-1), abundance of transcripts thereof, or LRP-1 receptor activity. The method is useful for treating neurodegenerative disorders such as dementia, depression, confusion, Creutzfeldt-Jakob
                                                                                         disease, Huntington's disease, Parkinson's disease, multiple sclerosis, loss of motor coordination, stroke and syncope. The present sequence is human amyloid-beta (A-beta) peptide used in the exemplification of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 23-MAY-2000;

                                                       The invention relates to an isolated synthetic immunogenic but non-amyloidogenic peptide homologous to amyloid beta. The peptide may be conjugated to polymer molecule. Antibodies raised against the peptides are also included. The peptide is useful for inducing an immune response to amyloid beta peptides and amyloid deposites and therefore treating Alzheimer's disease. The antibody is useful for reducing the formation of amyloid fibrils and deposite. The peptide has a reduced ability to adopt a beta-sheet confirmation as an antigenic source, and a much lower risk of leading to any toxic effects in humans. The present sequence is a synthetic immunogenic but non-amyloidogenic peptide of the invention
                                                                                                                                                                                              Novel isolated synthetic immunogenic but non-amyloidogenic peptide homologous to amyloid beta, useful for inducing immune response to amyloid beta peptides and amyloid deposits.
                                                                                                                                                                                                                                                                                                                                                                                                                              Misc-difference

                                                                                                                                                                                                                        The invention relates to an isolated synthetic immunogenic but non-amyloidogenic peptide homologous to amyloid beta. The peptide may be conjugated to polymer molecule. Antibodies raised against the peptides are also included. The peptide is useful for inducing an immune response to amyloid beta peptides and amyloid deposits and therefore treating Alzheimer's disease. The antibody is useful for reducing the formation of amyloid fibrils and deposits. The peptide has a reduced ability to adopt a beta sheet confirmation as an antigenic source, and a much lower risk of leading to any toxic effects in humans. The present sequence is a synthetic immunogenic but non-amyloidogenic peptide of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Homo sapiens

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present invention describes medicinal compositions (I) inhibiting beta-amyloid production comprising an active component a substance that inhibits the activity of cyclin-dependent kinase (CDK). Also described are: (1) a method for screening compounds for their ability to inhibit the production of beta-amyloid by contacting with beta-amyloid producing cells; and (2) screening kits. (I) have nootropic and neuroprotective activities. (I) suppress the phosphorylation of amyloid precursor protein (APP) which is an essential step in the production of beta-amyloid. (I) can be used in the treatment and prevention of neurodegenerative diseases such as dementia and Alzheimer's disease. The present sequence represents the A beta 1-40 amino acid sequence which is used in an example from the
                                                                                   Human; amyloid beta; cell death; neuron death; Alzheimer's disease; nootropic; neuroprotective; apoptotic.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Sequence 40
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Medicinal compositions for the treatment of dementia and Alzheimer's disease, comprise compounds that suppress beta amyloid production.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Suzuki T,

particle form having an activity of inducing cell death in nervous system cells at a protein concentration of not higher than 1 micro g/ml. Also cincluded are (1) a method for the preparation of a solution containing a cell-associating type amyloid beta protein having high toxicity including a step of convecting aqueous solution containing the amyloid beta protein and a step of fractionating the solution containing the self-associating type amyloid beta protein in the convected aqueous solution; (2) a reagent containing the above self-associating type amyloid beta protein; (3) a method for inducing cell death in nervous system cells by using the above self-associating type amyloid beta protein; (4) a method for convected agreement a method for corporation of a drug having inhibiting activity on neuron death; a substance having an inhibiting activity on neuron death; a substance containing the above substance as the active component. The drug is used for preventing and/or treating Alzheimer's disease. The present sequence is a human amyloid beta 1-40 peptide used in an example demonstrating preparation of the particle of the invention

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       멂
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present sequence is that of a protein comprising amino acids 1-40 of CC beta amyloid protein (or beta/A4). The invention provides a method for CC producing a rodent (especially rat) model of Alzheimer's disease, which ci involves infusing a proteoglycan and a beta-amyloid protein into the CC allow co-deposition, and detecting the amyloid deposit in the brain CC tissue using staining techniques (Congo Red or thioflavin S) for CC fibrillar amyloid. The beta amyloid protein is preferably comprised of 39 cr 43 amino acids. The persent peptide has the ability to self-aggregate CC and fold into a specific beta-pleated sheet. This can be observed using CC ongo Red staining. Inhibition of staining indicates that an inhibitor CC assay for selecting a candidate therapeutic for inhibition fibrillar accordary structure of the amyloid protein. In an in vivo CC assay for selecting a candidate therapeutic for inhibiting fibrillar anyloid deposition/persistence in the brain, the candidate reagent is CC administered to a rodent in an infusate comprising beta/A4 peptide and CC perlecan by continuous infusion for at least 1 week into the hippocampus. CC infusate diminishes Congo Red and thioflavin S staining indicative of congophilic and fibrillar beta/A4 amyloid deposition in the brain if the CC congophilic and fibrillar beta/A4 amyloid deposition in the brain if the CC congophilic and fibrillar beta/A4 amyloid deposition in the brain if the CC constitute of the candidate reagent is used to study the process of amyloidosis that occurs in CC hipding peptides) that may be used for the treatment of Alzheimer's and cc other amyloidosis diseases
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Query Ma

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to amyloid binding polycyclic derivatives especially thioflavin derivatives. The full structures of the compounds are given in the specification. Also included are methods for making the compounds; compositions for in vivo imaging of amyloid deposits compounds and an in vivo method for detecting anyloid deposits. The compounds show a KD for binding to Amyloid beta 1-40 peptide of 0.0001 to 10maM. The compounds are useful for in vivo imaging of amyloid deposits. The compounds are also useful for treating Alzheimer's disease, familial Alzheimer's disease, Down's syndrome and conditions associated with apolipoprotein E4 alleles. The present sequence is the amyloid beta 1-40 peptide used to test the compounds of

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      CC as Alzheimer's disease and spongiform encephalopathy. Disorders treatable conclude those caused or characterised by deposits of TTR (eg. familial camploid cardiomyopathy), PTP (eg. spongiform encephalopathies, including cc amyloid cardiomyopathy), PTP (eg. spongiform encephalopathies, including cc crapie in sheep, bowine spongiform encephalopathy in cows and cc creutzfeldt-Jacob disease (CJ) and Geretmann-Straussler-Scheinker cc syndrome (GSS) in humans), IAPP (eg. insulinoma, adult onset diabetes), CC ANF (eg. isolated atrial amyloid), kappa or lambda light chain (eg. cc idiopathic amyloidosis, myeloma), amyloid A (eg. amyloidosis), Apo A-I (eg. hereditary non-neuropathic systemic amyloidosis), Gelsolin (eg. familial amyloidosis of Finnish type), Fibrinogen (eg. hereditary renal camyloidosis), Lysozyme (eg. hereditary systemic amyloidosis). Other cc examples of amyloidogenic disorders include Huntington's disease and cinclusion body myocytis. The present sequence is human beta-amyloid peptide mutant. Note: This sequence is not shown in the specification but is derived from human beta-amyloid peptide shown as SEQ ID NO: 1
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to a compound comprising an immunoglobulin (Ig) heavy chain constant region or its fragment that retains the ability to bind an Fc receptor linked by a linker group or a direct bond to a peptide capable of binding an amyloidogenic protein. The invention is useful for clearing an amyloidogenic protein such as beta-amyloid, transthyretin (TTR), prion protein (FrP), islet amyloid polypeptide (IAPP), atrial natriuretic factor (ANP), kappa light chain, lambda light chain, amyloid A, procalcitonin, cystatin C, beta2-microglobulin, ApoA-I, gelsolin, calcitonin, fibrinogen, Huntington, alpha-synuclein and lysozyme from a subject and for treating an amyloidogenic disorder such
                                   Screening method for identifying comprises culturing the cells, exassociating Beta amyloid protein, the drug on cell death.
                                                                                                                                                                                                                                                           09-MAR-2000; 2000JP-00064984
                                                                                                                                                                                                                                                                                                                                          JP2001255318-A.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Matches
                            The invention describes a method of screening a DNA controlling the production of amyloid protein (Abeta) by transferring a DNA library into a cell line with enhancement of expression of a selection marker gene in promoting the Abeta production from a precursor protein (betaApp) fragment of Abeta, then identifying a DNA clone for transferring into a cell to enhance Abeta production. The methods are useful for screening genes that control production of amyloid beta. The genes, encoded protein and related DNA materials are useful in the diagnosis and development of drugs for Alzheimer's disease. This is the amino acid sequence of amyloid beta protein fragment
                                                                                                                                                                                                                                                     Screening diagnosis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present invention relates to a method of screening drugs that exhibit inhibitory action on neurone death, involving culturing neuronal cells, exposing them to a self-associating type amyloid beta protein of high toxicity, and assessing if the sample has had an inhibitory action on neurone death when the cell death of said nervous system cells or nervous system organs is inhibited. The method is used for screening a drug having inhibitory action on neurone death, which can then be used to treat Alzheimer's disease. The present sequence is the human amyloid beta
Sequence

                                                                                                                                                                                                                                                                                                                                               The invention relates to a measurement of the full length beta-amyloid (Abeta) peptide level of a specific Abeta peptide in a sample containing multiple types of Abeta peptide, by capturing and binding one terminus of the types of Abeta peptide, by capturing and binding one terminus of the types of Abeta peptides with a first antibody. The specific Abeta peptide is captured and bound at an opposite non-overlapping terminus with a second peptide. The invention is used for measuring full length Abeta peptide level useful for tracking the progression of Alzheimer's disease. The new method uses one specific antibody that recognises the N-terminus of all the Abeta peptides and a panel of detection antibodies that distinguish each Abeta peptide (Abeta 1-43, 1-42, 1-40 and 1-39) by their sequence difference at the C-terminus. This use of N and C-terminus specific antibodies allows simultaneous quantification of several Abeta peptides in a single assay. The present sequence is that of Abeta (1-40), used to raise the N and C-terminal antibodies of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Enabling measurement of full length beta-amyloid peptide level for tracking progression of Alzheimer's disease, comprises capturing binding terminus of beta-amyloid peptide with antibodies.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present invention relates to a method of identifying compounds that modulate the generation of one or more metabolites associated with a disease or disorder comprising determining levels of a cellular component protein or a conformation state of a cellular precursor protein. In precursor protein (APP), which is associated with Alzheimer's disease. It is also useful for identifying compounds as drugs for treating diseases or disorders associated with metabolic and/or proteolytic pathways. e.g. Alzheimer's disease, Parkinson's disease, Huntington's disease, lysosomal storage disorders, prion diseases, the tau-based neurodegenerative disorders, and other non-AD amyloidoses. The present sequence is an immunogenic portion of human APP
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Identifying compounds that modulates the generation of metabolites associated with a disease or disorder, for treating e.g. Alzheimer disease by determining levels of a cellular component protein, or conformation state.
                                                                                                                                                                       Human
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Sequence 40 AA;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Example 1; Page

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           or the formation of an amyloid deposit. The method comprises administering a dosage of one or more agent(s) that bind(s) to a molecule selected from an integrin subunit such as alpha5, alpha4 or betal, an integrin such as alpha2betal, alpha6betal or alphavbetal, and laminin, under conditions such that the agent(s) inhibit amyloid toxicity or the formation of an amyloid deposit. Amyloids have nootropic, neuroprotective, antidiabetic and antiparkinsonian activities, and can be used in gene therapy. The method is useful for inhibiting amyloidogenic protein toxicity, inhibiting the formation of an amyloidogenic protein toxicity, inhibiting the formation of an amyloidogenic protein toxicity, inhibiting the formation of an amyloidogenic protein deposit and/or treating amyloidogenic disease, such as Alzheimer's disease, type II diabetes, Parkinson's disease, such as Alzheimer's syndrome. The present sequence represents a human Abeta peptide designated Abeta40, which is given in the exemplification of the present

It is also used for treating AA (reactive) amyloid diseases including inflammatory diseases e.g. rheumatoid arthritis, juvenile chronic arthritis, ankylosing spondylitis, psoriasis, psoriatic arthropathy, Reiter's syndrome, Adult Still's disease, Bechet's syndrome and Crohn's disease. AA deposits are also produced as a result of chronic microbial infections (preferably leprosy, tuberculosis, bronchiectasis, decubitus ulcers, chronic pyelonephritis, osteomyelitis and Mhipple's disease). Certain malignant neoplasms can also result in AA fibril amyloid deposits

The method is used for preventing and/or treating amyloid-beta peptide.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to a novel method for diagnosing Alzheimer's disease in vivo by injecting a labeled A-beta peptide, its functional derivative, fragment, variant, analogue or chemical derivative, into a patient to be diagnosed, and imaging pre-amyloid deposits and plaque using magnetic resonance imaging. The methods of the invention are useful for diagnosing Alzheimer's disease and for monitoring amyloid clearing. The peptides are useful for imaging pre-amyloid deposits and Congo-red positive amyloid plaques. The present sequence represents a A-beta peptide of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Diagnosing Alzheimer's disease in vivo comprises injecting beta peptide, into a patient to be diagnosed, and imaging I deposits and plaque using magnetic resonance imaging.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Amyloid precursor protein; A-beta peptide; angiogenesis; psoriasis; angiogenesis-mediated disease; cancer; arthritis; atherosclerosis; macular degeneration; diabetic retinopathy; Alzheimer's disease; cerebral amyloid angiopathy; cerebrovascular disease; brain injury.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Wisniewski T,
                                                                                                Inhibiting angiogenesis, and preventing or alleviating the symptoms of an angiogenesis-mediated disease, e.g. cancer, arthritis or atherosclerosis, comprises increasing in vivo concentrations of an A-beta peptide in the

A-beta peptides are used if the method of the invention. The specification describes a method of inhibiting angiogenesis, and preventing or alleviating the symptoms of angiogenesis-mediated disease in a patient. The method comprises increasing in vivo concentrations of an A-beta peptide within the patient. The A-beta peptides are useful for preventing or alleviating angiogenesis-mediated diseases such as cancer, arthritis, atherosclerosis, psoriasis, macular degeneration and diabetic retinopathy. A-beta peptide antagonists may be used to treat Alzheimer disease, cerebral amyloid angiopathy cerebral disease in the presence of Alzheimer's disease, or traumatic brain injury
                                                                                                                                                                                                                                                                                                                                                                                    Homo sapiens.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Query Match
Best Local :
The present sequence is that of a novel immunogenic but non-deposit forming polypeptide derived from amino acid residues 1-30 of amyloid beta (1-42) protein (see also ABR42769). The novel polypeptide maintains the 2 major immunogenic sites of amyloid beta peptide. It is used, alone or conjugated to an immunostimulant in an immunizing composition, to induce an immune response to amyloid beta peptides. The immunizing composition is used in a claimed method of reducing amyloidosis. Antibodies directed against the peptide can be used in passive immunization. The use of non-fibrillar/non-toxic amyloid beta peptides i
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           the C-terminus to further preserve antigenicity. The polypeptide, or conjugated to an immunostimulant in an immunizing composition, used to induce an immune response to amyloid beta peptides. The immunizing composition is used in a claimed method of reducing amyloidosis. Antibodies directed against the peptide can be used passive immunization. The use of non-fibrillar/non-toxic amyloid peptides is a safer vaccination approach for humans
                                                                                                                                                                                                                                                                                         New synthetic immunogenic but non-deposit forming peptides, useful inducing an immune response to prions, amyloids, amylin or amylin fibrils, particularly for treating e.g. Alzheimer's, scrapie or Creutzfeldt-Jacob disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              21-NOV-2002;

of amyloid fibrils or plaques without causing neurotoxicity. The method comprises administering an inactivation effective amount of an amyloid peptide-inactivating enzyme to a mammal. The strategy is to hydrolyse the amyloid beta (Abeta) peptides before they form amyloid plaques using the zinc metallopeptidase insulin degrading enzyme (IDE), insulysin or neprelysin. The methods and enzymes are useful for treating (e.g peptide therapy) Alzheimer's disease. The enzymes are useful for inducing the synthesis of endogenous amyloid inactivating enzymes, such as insulysin
                                                                                                                                                                                                            Hersh
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  amyloid
insulin
                                                                                                                                        Preventing formation or growth of amyloid fibrils or plaques without causing neurotoxicity, useful for treating Alzheimer's disease, comprises administering an amyloid peptide inactivating enzyme.
                                                                                                                                                                                       WPI;

The present invention describes a method for the treatment or amelioration of symptoms of an amyloid-beta peptide (Abeta)-related disorder, which involves the administration of an adenosine triphosphate (APP) dependent enzyme activity modulator or APP modulator (A). (A) has nootropic and neuroprotective activities. The method is used for treating or ameliorating a symptom of an Abeta-related disorder e.g. Alzheimer's disease in a subject e.g. human, who is at risk for familial form of Alzheimer's disease. (A) can also be used for the treatment of senile dementia, Down's syndrome, inclusion body myositis, memory loss, mild cognitive impairment, cognitive decline, severe cognitive impairment and personality changes that result in loss of functional ability. The present sequence represents a human beta-amyloid precursor protein (APP) amino acid sequence of residues 597 to 636, corresponding to Abeta 1-40, which is given in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Treatment or amelioration of symptom of amyloid-beta peptide-related disorder e.g. Alzheimer's disease comprises administration of an adenosine triphosphate (ATP)-dependent enzymatic activity modulator or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               amyloid-beta peptide related disorder; Abeta-related disorder; adenosine triphosphate dependent enzyme activity modulator; ATP-dependent enzyme activity modulator; ATP modulator; nootropic; neuroprotective; Alzheimer's disease; senile dementia; Down's syndrinclusion body myositis; memory loss; mild cognitive impairment; cognitive decline; severe cognitive impairment; personality change;

                                                                                                                                                             This invention relates to a novel method of treating Alzheimer's disease and comprises contacting a neuronal cell with a composition comprising at least one compound that reduces membrane depolarisation of neuronal cells caused by aggregated beta-amyloid protein degredation products. The compounds of the invention may have nootropic or neuroprotective activities. Beta-amyloid peptides are neurotropic or neuroprotective cause neuronal cell dysfunction and cell loss characteristic of Alzheimer's disease. Identification of the cytotoxic mechanisms involving beta-amyloid peptides may provide a method of desiging compounds capable of antagonising the effects of aggregation of beta-amyloid peptides and developing treatments for Alzheimer's disease. The present sequence is that of a human beta-amyloid peptide related to the invention which was used as a model peptide for investigating the role of beta-amyloid peptides on calcium homeostasis in neuronal cells.
                                                                                                                 Sequence 40
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Treating Alzheimer's composition comprisi

                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to a method of determining the rate of biosynthesis or breakdown of at least one inaccessible biological molecule in a subject. The method is useful for diagnosis or monitoring and treatment of diseases associated with an altered rate of biosynthesis/breakdown of an isotopically labelled precursor molecule, specifically osteoporosis; left-ventricular hypertrophy; liver cirrhosis or fibrosis; congestive heart failure; scleroderma; coal-miner's pneumoconiosis; cardiac or lung
                                                                                                                                                                                                                                                                                                                                                                         fibrosis; Alzheimer's disease; multiple sclerosis; rheumatoid arthritis; diabetes mellitus; muscle-wasting syndromes; muscular dystrophy; athletitraining and cancer. The method is also useful for screening candidate

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present invention relates to a method for screening compounds that inhibit production of amyloid beta protein or its salt using XB31 alpha/beta, X11L, APPbeta or XB51 (ADC65991-ADC66000). The compound is useful in a pharmaceutical and composite or its salt. The pharmaceutical is used as therapeutic agent for treating Alzheimer's disease. The present sequence was used to illustrate the invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to a method for treating Alzheimer's disease comprising contacting a neuronal cell with a pharmaceutical composition comprising compound(s) that decreases membrane depolarisation of neuronal cells caused by aggregated beta-amyloid (Abeta) protein degradation products. The invention also relates to a pharmaceutical composition composition compound(s) that decreases membrane depolarisation of neuronal cells, compound(s) that decreases calcium influx of neuronal cells, and a secretase inhibitor, treating a subject having a condition characterised by neuronal membrane depolarisation comprising administering a composition comprising a tyrosine kinase inhibitor, a chloride channel composition comprising a tyrosine kinase inhibitor, a chloride channel composition comprising a tyrosine kinase inhibitor, a chloride channel composition antagonist, and identifying lead compounds for a pharmacological antagonist, and identifying lead compounds for a pharmacological conditions associated with increased neuronal depolarisation induced by the presence of Abeta aggregates. The method is used for treating Alzheimer's disease and conditions characterised by neuronal membrane depolarisation and for identifying lead compounds for pharmacological antagonist. This sequence represents a beta-amyloid peptide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Query Match

                                                                                                                                                                                                                                                                                  The invention relates to a method of preventing formation or growth of amyloid plaque without causing neurotoxicity which comprises generating recombinant viral or plasmid vector comprising a DNA sequence encoding a least one amyloid peptide inactivating enzyme operably linked to a promoter. The methods are useful for treating Alzheimer's disease by increasing the activity of an amyloid inactivating enzyme. The present sequence represents the amino acid sequence of human A beta 1-40.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Preventing formation or growth of amyloid plaques without causing neurotoxicity, useful for treating Alzheimer's disease, by generating vector comprising a DNA sequence encoding at least one amyloid peptide

Sequence 40 AA;

The invention relates to a human fusion antibody for preventing and treating senile dementia. The antibody recognises and binds the beta-amyloid peptide and the fibres generated by it. The human antibody Pc segment recognized by human immunocells are sequentially contained by terminals from N to C. The fusion gene coding for the antibody is also disclosed. This sequence represents a beta-amyloid peptide recognised ly

                                                                                                                                                                                                                                                                                                                 The invention relates to a method of screening for DNA which controls production of amyloid A(beta) protein, comprising transducing a DNA library which promotes the production of A(beta) protein from beta-amyloid precursor protein (APP) protein, into the cell strain, so that expression of selective-marker gene is enhanced, and identifying the transduced clone which enhances the production of A(beta). The method is useful for screening DNA that controls production of A(beta). The method is useful for screening DNA that control this expression, antibodies to the proteins, antisense nucleic acids and inhibitors of the proteins are useful for diagnosing and treating Alzheimer's disease. The antisense nucleic acids and inhibitors are also useful for treating neurodegenerative diseases such as Down's Syndrome, Parkinson's disease, amylotrophic lateral sclerosis, diabetic neuropathy, etc. This sequence corresponds to the amino acid sequence of the amyloid A(beta)40 protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Screening of DNA controlling amyloid beta protein production by transducing DNA that promotes amyloid beta production from preciprotein, into cell, identifying transduced clone which enhances
  ADN00693 standard; protein; 40

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               composition is useful for preventing or treating a disease or condition characterized by the presence of amyloid deposits, e.g. Alzheimer's disease. The present sequence is an amyloid peptide, which forms an amyloid peptide aggregate which produces a conformational epitope, and was used to illustrate the invention.

The method comprises administering to a subject a pharmaceutical composition comprising an antibody that binds preferentially to amino acids 28-40 of beta-amyloid peptide (1-40). The method is useful for diagnosing, treating or preventing diseases associated with expression of amyloid-beta peptide, such as Alzheimer's disease or Down's syndrome. The present sequence represents a beta-amyloid peptide (1-40) variant, with the change G37A. It was used to test antibodies of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Treating or preventing diseases associated with expression of amyloid-beta peptide, e.g. Alzheimer's disease or Down's syndrome, comprises administering an amount of an antibody directed against amyloid-beta
Treating or preventing diseases associated with expression of amyloid-
beta peptide, e.g. Alzheimer's disease or Down's syndrome, comprises
administering an amount of an antibody directed against amyloid-beta

                                                      The specification describes a method for treating Alzheimer's disease. The method comprises administering to a subject a pharmaceutical composition comprising an antibody that binds preferentially to amino acids 28-40 of beta-amyloid peptide (1-40). The method is useful for diagnosing, treating or preventing diseases associated with expression of amyloid-beta peptide, such as Alzheimer's disease or Down's syndrome. The present sequence represents a beta-amyloid peptide (1-40) variant, with the change V40A. It was used to test antibodies of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The specification describes a method for treating Alzheimer's disease. The method comprises administering to a subject a pharmaceutical composition comprising an antibody that binds preferentially to amino acids 28-40 of beta-amyloid peptide (1-40). The method is useful for diagnosing, treating or preventing diseases associated with expression of amyloid-beta peptide, such as Alzheimer's disease or Down's syndrome. The present sequence represents a beta-amyloid peptide (1-40) variant, with the change VJ9A. It was used to test antibodies of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                           Treating or preventing diseases associated with expression of amyloid-
beta peptide, e.g. Alzheimer's disease or Down's syndrome, comprises
administering an amount of an antibody directed against amyloid-beta
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    09-OCT-2002; 2002US-0417232P.

                                                                                                                                                                                                                                                                                                                                                                                              The specification describes a method for treating Alzheimer's disease. The method comprises administering to a subject a pharmaceutical composition comprising an antibody that binds preferentially to amino acids 28-40 of beta-amyloid peptide (1-40). The method is useful for diagnosing, treating or preventing diseases associated with expression of amyloid-beta peptide, such as Alzheimer's disease or Down's syndrome. The present sequence represents a beta-amyloid peptide (1-40) variant, with the change V36A. It was used to test antibodies of the invention.
                                                                                                                                                                                                                                                                                                                                                         Sequence 40 AA;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Treating or preventing diseases associated with expression of amyloid-
beta peptide, e.g. Alzheimer's disease or Down's syndrome, comprises
administering an amount of an antibody directed against amyloid-beta
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             WPI; 2004-340802/31.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The method comprises administering to a subject a pharmaceutical composition comprising an antibody that binds preferentially to amino acids 28-40 of beta-amyloid peptide (1-40). The method is useful for diagnosing, treating or preventing diseases associated with expression amyloid-beta peptide, such as Alzheimer's disease or Down's syndrome. To present sequence represents a beta-amyloid peptide (1-40), to which antibodies of the invention bind.
                                                       22-APR-2004
                                                                                                                                                                   Unidentified
                                                                                                                                                                                                                       Alzheimer's disease;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Sequence 40
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Treating or preventing diseases associated with expression of amyloid-
beta peptide, e.g. Alzheimer's disease or Down's syndrome, comprises
administering an amount of an antibody directed against amyloid-beta
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              WPI; 2004-340802/31

The method comprises administering to a subject a pharmaceutical composition comprising an antibody that binds preferentially to amino acids 28-40 of beta-amyloid peptide (1-40). The method is useful for diagnosing, treating or preventing diseases associated with expression amyloid-beta peptide, such as Alzheimer's disease or Down's syndrome. T present sequence represents a beta-amyloid peptide (1-40) variant, with the change G38A. It was used to test antibodies of the invention.

The method comprises: (a) immobilising a quantity of a selected sulphated glycosaninoglycan (SGAG) or a GAG-related macromolecule on a selected medium, and (b) adding to the immobilised SGAG on the medium a quantity of dissolved low fibrillar Abeta 1-40 (LFADeta). The present sequence represents the human beta-amyloid protein (Abeta 1-40, also known as Abeta 40), which is given in the exemplification of the present invention. The method can be used in the treatment of Alzheimer's disease and Parkinson's disease.
The present sequence is that of a human amyloid-beta peptide corresponding to amino acid residues 672-711 of the amyloid-beta precursor protein 770. The peptide was used in an example from the invention in which its binding to various forms of apolipoprotein E (apoE) was evaluated. High affinity binding was demonstrated, suggestin that apoE may be useful as an amyloid-beta binding compound for therapeutic purposes. A claimed method of treating a patient suffering from an amyloid-beta in a body fluid of the patient. The binding complex formed between the compound and amyloid-beta is excreted from the patient. The amyloid disease is especially Alzheimer's disease. Suitable compounds include apoE2, apoE3 and apoE4. Another claimed method of treating an amyloid-beta. The method uses a membrane, filter or column comprising a bound compound (e.g. apoE) that binds amyloid-beta. The

The present invention describes compositions (C) comprising: (a) a first agent (a1) that prevents or treats amyloid-beta related disease; and (b) a second agent (a2) that is: (i) a peptide or peptidomimetic that modulates amyloid-beta fibril formation or induces a prophylactic or therapeutic immune response against amyloid-beta fibril formation; or (ii) an immune system modulator that prevents or inhibits amyloid-beta fibril formation. Also described is a kit comprising (C). (C) have
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       mild-to-moderate cognitive impairment; vascular dementia; cerebral amyloid angiopathy; hereditary cerebral haemorrhage; senile dementia; bown's syndrome; inclusion body myositis; age-related macular degeneration; hypothyroidism; cerebrovascular disease; cardiovascular disease; memory loss; anxiety; behavioural dysfunction; neurological condition; psychological condition;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to a method for diagnosing or providing a prognosis CC regarding the state of Alzheimer's Disease (AD) in a mammal. The method CC involves contacting an ocular tissue with a detectably-labelled compound to the ocular tissue compared to the normal control level of CC compound to the ocular tissue compared to the normal control level of CC disorder e.g. Familial AD. Sporadic AD. Creutzfeld-Jakob disease, spongiform encephalopathies, prion disease, variant CC cincluding scrapie, bovine spongiform encephalopathies, prion disease (CC including scrapie, bovine spongiform encephalopathy and other veterinary CC prionopathies), Parkinson's disease, Huntington's disease (and CC syndrome (Trisomy 21), Pick's Disease, Huntington's disease, Down's CC syndrome (Trisomy 21), Pick's Disease (Frontotemporal Dementia), Lewy CC disease, neurodegeneration with brain iron accumulation (CC disease, multiple system atrophy, dementia with Lewy Bodies, and others), neuronal intranuclear inclusion disease, tauopathies (including corpressive supranuclear palsy, Pick's disease, corticobasal corpressive supranuclear palsy, Pick's disease, tauopathies (including corpressive supranuclear palsy, Pick's disease, tauopathies (including corpressive supranuclear palsy, Pick's disease, tauopathies (including corpressive supranuclear palsy, Pick's disease, corticobasal complex). The present sequence is the human amyloid-beta (Abeta) corporation, hereditary frontotemporal dementia with or without corporation. The present sequence is the human amyloid-beta (Abeta) corporation complex). The present sequence is the human amyloid-beta (Abeta) corporation complex).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Query Match

The chaperone proteins are alpha-chymotrypsin or apolipoprotein E. The methods of the invention are useful for preventing and/or treating Alzheimer's disease. The current sequence represents a synthetic peptide that inhibits interaction between amyloid-beta and its chaperone proteins.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Preventing or treating Alzheimer's disease in a subject comprises administering to the subject an agent (a peptide or peptidomimetic) thinhits interaction between amyloid-beta and proteins which chaperone amyloid-beta.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       27-JAN-2005 (first entry)

CC enzyme a target in drug development. The invention relates to the cidentification, screening and use of effectors of QC for the preparation CC of a medicament for: (a) the treatment of diseases that can be treated by condulation of QC activity in vivo; and/or (b) the modulation of CC physiological processes based on the action of pGlu-containing peptides CC caused by modulation of QC activity. The QC effectors are used to alter CC the conversion of N-terminal Glu or Gln residues to pGlu residues to alter CC Alzheimer's disease, Down Syndrome, Huntington's disease, Levent disease, Down Syndrome, Huntington's disease, Kennedy's CC disease, ulcer disease and gastric cancer without Helicobacter CC pylori infections, pathogenic psychotic conditions, schizophrenia, CC impaired humoral and cell-mediated immune responses, cancer, malign CC metastasis, melanoma, psoriasis, rheumatoid arthritis, atherosclerosis, CC impaired humoral and cell-mediated immune responses, leukocyte adhesion CC makefulness, impaired homeostatic regulation of energy metabolism, impaired autonomic function, impaired hormonal balance and impaired CC regulation of body fluids. The effectors of QC are also useful for: cregulating and/or controlling male fertility; stimulating and for CC differentiating acid-producing parietal cells and histamine secreting CC enterochromatefin-like cells (all claimed). Amyloid beta peptides were also shown to be substrates of dipeptidyl peptidase IV (DP IV) and DP IV-like enzymes, and preferered effector compositions additionally comprise cc inhibitors of these enzymes.
                                                                                                       Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              amyloid beta peptides. The invention shows that glutaminyl cyclase (QC, EC 2.3.2.5) is involved in the cyclisation of Glu to pGlu, making this enzyme a target in drug development. The invention relates to the identification
                                                                                                                                                                                                              Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present sequence is that of amyloid beta peptide (1-40). Pyroglutamate (pGlu)-containing isoforms of amyloid beta peptides represent the prominent forms of N-truncated amyloid beta peptides senile plaques. The pGlu modification exacerbates the toxic propert
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      05-MAY-2003; 2003US-0468014P.

The method comprises performing a proteomic technique. The method of the invention neuroprotective and nootropic applications. The method of the invention may be useful in screening for a compound which inhibits the interaction between beta amyloid and a beta amyloid-binding protein. The beta amyloid binding protein may be useful as an effective agent against Alzheimers disease. The current sequence is that of the beta amyloid 40 peptide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Comprehensive identification of beta amyloid binding protein expressed brain, for use against Alzheimer's disease, comprises performing a

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present invention relates to the Streptomyces sp. beta-amyloid aggregation inhibiting protein and its encoding DNA. The invention useful in treating neurodegenerative disorders, such as Alzheimer's disease or Down's Syndrome. The present sequence is the human beta amyloid peptide.
                                                                                                                                                                                                                                                                                                                                                            amyloid, Alzheimers disease, Parkinsons disease, Creurzfeldt Jakob disease, antiparkinsonian, neucerebroprotective.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   (AHNJ/)

The invention describes a preventive and therapeutic agent (I) of an Alzheimer's disease, mild cognitive impairment or brain amyloid angiopathy, comprising a monoclonal antibody (Al) reacting specifically with a partial peptide in the C terminal of beta-amyloid or its derivative(s), where Al does not recognize the partial peptide of beta-amyloid comprising a 11 amino acid sequence (SEQ ID No. 8) fully defined in the specification. (Al) is useful for manufacturing the preventive-therapeutic agent (I) which is administered in order to prevent and treated the specification of the second of the second
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      oligos, vectors comprising such DNA oligos and pharmaceutical compositions containing the RNA aptamers or the vectors aforementioned. Accordingly, the RNA aptamers or encoding vectors are useful for treating or preventing a disease caused by the accumulation, production or proliferation of amyloid fiber including Alzheimer's disease, Parkinson's disease and prion diseases such as BSE and Creutzfeldt Jakob disease. Furthermore, these pharmaceutical compositions exhibit antiparkinsonian, neuroprotective, nootropic and cerebroprotective activities. This
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     This invention relates to RNA molecules that are capable of inhibiting amyloid fiber formation. Specifically, it refers to any one of 15 fully defined 88, 89 or 90 RNA nucleotide aptamers given in the specification or sequence variants thereof. The present invention describes DNA cligos
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          cerebroprotective; nootropic; neuroprotective; diagnostic; Alzheimers disease; degeneration; neurological disease; cognitive disorder; beta-amyloid; amyloid protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Human beta-amyloid residues

```

The invention relates to a composition comprising an isolated monoclonal antibody which binds to a conformational epitope of a prefibrillar aggregate which forms in a human or animal contributing to amyloid fibril formation, the monoclonal antibody being specific for a conformation-dependent epitope that is preferentially displayed by oligomeric conformations of Abeta and other amyloids. Also included are a preparation comprising at least one monoclonal antibody cited in the composition cited above in combination with at least one anti-inflammatory agent, a composition (comprising a monoclonal antibody which inflammatory agent, a composition (comprising a monoclonal antibody which

fibril

of a

antibody which s in a human or
